Understanding Your Results

Priority Analysis

Top Priorities and Priority Levels presented throughout this report are calculated by HealthStream to identify which attributes would have the greatest impact on the overall scores for your organization, and which attributes are most in need of attention and resources.

Using the simultaneous analysis of importance (correlations), current performance (percentile rankings) and performance over time (trending), a Priority Index Score generates (ranging from 0 to 100 with 100 indicating highest priority). Based on this Index Score, all performance attributes are grouped into three levels of priority – high, medium and low.

To improve reliability, a 12-month lookback period is used when calculating Priority Index Scores. Outcome questions (e.g., likelihood to recommend, overall rating) and demographics are not included in the analysis.

Additional information on the Priority Analysis can be accessed [here](#).

Certificates of Achievement & Excellence

To support your efforts to recognize high performance, this report includes Certificates for each of your facilities and units/providers that achieve one of the following thresholds:

Certificate of Excellence: Given to facilities/units/providers with an overall rating score at or above the 90th percentile in a reporting period.

Certificate of Achievement: Given to facilities/units/providers with an overall rating score between the 75th and 89th percentiles in a reporting period.

At least 30 completed surveys for a reporting period are required to receive a certificate.

Commonly Used Terms

Top Box Score: Top Box is the percentage of respondents who answered a question with the most positive response and is used by CMS when reporting patient survey results.

HSTM DB: HealthStream Database.

Percentile Rank: The percentile indicates a facility's relative position within a benchmark group in terms of the percentage of facilities it scores higher than. For example, a hospital that is ranked at the 80th percentile of the HealthStream Database for a given measure indicates that this hospital has received a score that is higher than the scores of 80% of the hospitals within the HSTM Database.

Correlation Coefficient: Correlation is used to measure the strength of the relationship between two variables. HealthStream looks at the strength of the relationship between the key indicator and other survey items to determine which questions in a survey are most closely related to the key indicator.

Statistical Significance: Statistical differences are provided in various pages of the report and are highlighted with red/green arrows. Statistical testing is only conducted when the sample size for the question is 30 or more.

Additional information on reporting terms can be accessed [here](#).

Insights Dashboard

The Insights Dashboard page provides a summary of findings from your survey results. The page is available both at the facility level and at the unit/provider level.

Additional information on Insights Dashboard can be accessed [here](#).
